EDUCATION

Adelaide University

Bachelor of Software Engineering (Honours)

Adelaide, SA

Feb 2024 – Nov 2027

EXPERIENCES

Software Engineer Intern

Aug 2026 – Current

James Anthony Consulting

Adelaide, SA

- Build a cross-platform aged-care compliance platform end-to-end, developing the front end in **React Native** and back-end services APIs in **Django** to support consent-capture workflows, compliance gates, and role-based staff workspaces
- Write automated tests mapped to the acceptance matrix across the **React Native** frontend and **Django** backend, and support **QA** and user-acceptance testing, including logging, triaging, and helping resolve defects
- Design and implement data models and **API** contracts, translating documented functional requirements into working software, using **Git** for version control and code review throughout development

Software Engineer Intern

Jun 2025 – Sep 2025

InnovateAI

Adelaide, SA

- Reduced administrative processing time by **30%** by designing and deploying backend automation services using **C#** and **REST APIs**, eliminating manual workflows across internal systems.
- Cut system latency by **15%** by optimizing **PostgreSQL** queries and backend logic, enhancing performance for a B2B SaaS platform serving **500+** users in business.
- Accelerated feature delivery by **22%** by leading end-to-end implementation of **3** internal REST API endpoints from design to deployment, and establishing **Docker** and **Git** workflow standards adopted team-wide, reducing environment-related issues and improving engineer onboarding.

Peer Assisted Study Session Leader

Jan 2025 – Current

Adelaide University

Adelaide, SA

- Improved student performance across core programming courses by mentoring **30+** students weekly in algorithms, recursion, and debugging techniques.
- Strengthened foundational programming skills across **Java**, **Python**, and **C#** by guiding students through real problem-solving scenarios and practices with coding challenges.
- Increased student assessment pass rates by **12%**, tracked via semester-end grade distributions, by identifying recurring misconceptions in weekly sessions and iterating lesson content around high-failure topics such as recursion, linked lists, and OOP design patterns.

EXTRACURRICULARS

Adelaide University Competitive Programming League

Oct 2025 – Current

- Ranked in the top **3%** out of all participants during the 2025 and 2026 contests by solving complex algorithmic problems under **6-hour** time constraints.
- Strengthened problem-solving and optimisation skills across graph theory, dynamic programming, and data structures and collaborated in team-based **ICPC-style** contests to design efficient problem-solving strategies.

Algothon 2026

Jul 2026 – Jul 2026

- Achieved a **top 100** ranking among **200+** teams in an algorithmic trading competition by developing a statistical arbitrage strategy using cross-sectional mean reversion, volatility targeting, and risk-adjusted portfolio optimisation while collaborating in a **3-person team**.
- Improved trading model robustness through walk-forward validation and out-of-sample holdout testing, achieving a Sharpe ratio of **2.13** on unseen data by implementing dynamic position sizing, signal ensembles, and risk controls.

PROJECTS

StyleFusion | *Python, PyTorch, Streamlit, Docker, AWS EC2*

[Github](#)

- Developed a **Neural Style Transfer** application in **PyTorch** that generated **512×384** stylized images in **24.6** seconds (CPU-only), by implementing a pretrained **VGG19** feature extractor with custom content and style loss functions using Gram matrices.
- Containerised a **Docker** pipeline with optimised layer caching and a CPU-targeted PyTorch build, cutting image build time from **6+** minutes to under **3** and deployed to **AWS EC2**.

GlobalGuard | *React, ThreeJS, NodeJS, MongoDB, Docker, Kubernetes, Terraform*

[Github](#)

- Accomplished real-time visualisation of **2000+** global disaster events by building a fullstack **3D globe** with **GlobeGL** and **ThreeJS** using live NASA EONET APIs, achieving **100%** geographic accuracy across worldwide events, maps through **MongoDB Atlas**.
- Containerised using **Docker** multi-stage builds and deployed to **Kubernetes** with OCI **Terraform**'s infrastructure, achieving zero-downtime rolling updates and load-balanced horizontal scaling across **3** replicas.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, Java, C++, C#, SQL

Frameworks: PyTorch, Django, React, NodeJS, ThreeJS, ASP.Net, PostgreSQL, MySQL, MongoDB

Tools: AWS, Terraform, Kubernetes, Docker, Linux, Git, CI/CD pipelines, REST APIs
